

Safer Bolt Tightening Products for Draglines

IBS System

The IBS (Intermediate Boom Support) System has been developed with support from Monadelphous Engineering in the Hunter Valley region to overcome health and safety concerns relating to the use of standard equipment.

The IBS System by Technofast is a tensioning system that, once installed, remains in place on the boom so that large bolt tensioners do not have to be moved around on a regular basis at great heights. The IBS System allows the loads on the ropes to be accurately monitored at any time. All that is required is a hydraulic hand pump and hoses.

The safety aspects of the IBS System make this a must have product for all Draglines.

EziTite Hydraulic Nuts

Technofast's Hydraulic Nuts are used extensively through out Australia's Draglines, this is mainly due to the safety improvements and the reduced maintenance times experienced.

Technofast's EziTite Hydraulic Nuts are used on numerous applications where: accurate bolt loads are required, bolts are in confined spaces and are difficult to access, constant adjustments are required, vibration or breakage is causing downtime or there are health & safety concerns. Some common applications include motor hold down bolts and hoist & drag pedestal drums.

Technofast have a standard range of products available or can modify the design to suit the application.
Contact Technofast directly to discuss your requirements.

Technofast's products offer reliable and precise tensioning which is achieved with little physical effort. There is a standard range of products available or the Technofast design team can reconfigure the tool to meet your specifications.
